vPROTECT 4.3 N O V A

modern data protection for virtual machines, containers & cloud environments

vProtect is an enterprise backup and recovery solution for modern workloads developed by Storware. It provides agentless data protection services for multiple virtualization and container platforms, storage providers, and applications running on-prem and in the cloud.

Storware vProtect is a versatile and reliable data protection solution with competitive functionalities and a modern, intuitive HTML5 Web Interface.

vProtect 4.3 introduces many compelling changes.

A brand new vProtect 4.3 brings a Nutanix Volume Groups storage provider and a technical preview of Huawei FusionCompute support. Now you can protect 20 different open source and commercial virtualization platforms and storage providers under one license!

The synthetic backup provider now can also use Data Domain as the backend to provide both forever incremental and highly effective deduplication. Additionally, the S3 backup provider now also supports Cloudian S3 and Alibaba Cloud OSS.

Role-based access control (RBAC) has also been extended to support instance-level permissions in the roles so that administrators can control access even more granularly.

Finally, a few UI enhancements have been added, such as additional options in the configuration wizard, the option to export reports in HTML or PDF format, or the option to disable all schedules at the policy level.
